**Dr. Ahmed ElShafee**

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

## Charge

- What is charge?
  - Electron: Considered a point object with radius less than  $10^{-18}$  meters with electric charge  $e = -1.6 \times 10^{-19}$  Coulombs (SI units) and mass  $m_e = 9.11 \times 10^{-31}$  kg
- How do we visualize it?
  - We only know charge exists because in experiments electric forces cause objects to move.
- Charge is analogous to mass in mechanics, We know how it behaves, but we don't know what it really is.
- The same is true for charge.

---

## quantization of charge

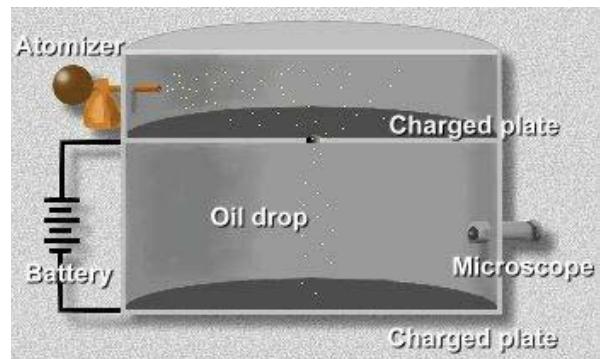

- Discovered in 1911 by Robert A. Millikan in the oil drop experiment
- The unit of charge is so tiny that we will never notice it comes in indivisible lumps.

٢

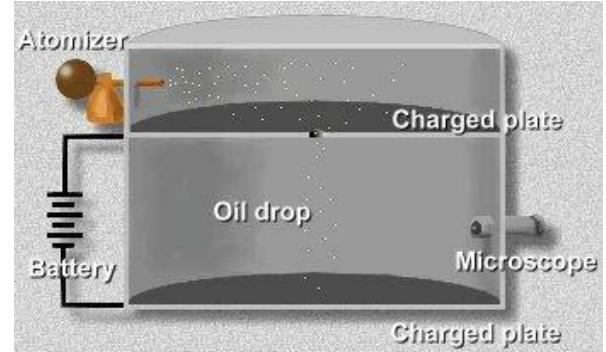

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

---

- An experiment performed by Robert Millikan in 1909 determined the size of the charge on an electron.
- He also determined that there was a smallest 'unit' charge, or that charge is 'quantized'.
- He received the Nobel Prize for his work.
- What Millikan did was to put a charge on a tiny drop of oil, and measure how strong an applied electric field had to be in order to stop the oil drop from falling.

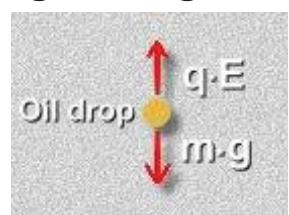

- Since he was able to work out the mass of the oil drop, and he could calculate the force of gravity on one drop, he could then determine the electric charge that the drop must have.
- By varying the charge on different drops, he noticed that the charge was always a multiple of  $-1.6 \times 10^{-19}$  C, the charge on a single electron.
- This meant that it was electrons carrying this unit charge.

◦ Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- When a drop is suspended, its weight  $m \cdot g$  is exactly equal to the electric force applied  $q \cdot E$
- The values of  $E$ , the applied electric field,  $m$  the mass of a drop, and  $g$ , the acceleration due to gravity, are all known values. So you can solve for  $q$ , the charge on the drop:

$$q \cdot E = m \cdot g$$

$$q = \frac{m \cdot g}{E}$$

- The charge  $q$  on a drop was always a multiple of  $-1.6 \times 10^{-19}$  C, the charge on a single electron.

# Example 00

---

- Suppose in a typical experiment we charge an object up with a nanoCoulomb of charge ( $Q = 10^{-9} \text{ C}$ ).
- How many elementary units,  $N$ , of charge is this?

Y

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

---

- Elementary unit of charge  $e = +1.6 \times 10^{-19} \text{ C}$

$$N = \frac{Q}{e} = \frac{10^{-9} \text{ C}}{+1.6 \times 10^{-19} \text{ C}} = 0.625 \times 10^{10} = 6.25 \times 10^9$$

- Six billion units of charge

A

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

# Coulombs Law

- In 1785 Charles Augustin Coulomb reported two charged bodies repelled each other with a force that is inversely proportional to the distance, and proportional to quantity of charges.

$$F = k \frac{q_1 q_2}{r^2} \text{ where } k = 8.99 \times 10^9 \text{ Nm}^2/\text{C}^2$$

$$\text{Also } F = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r^2} \text{ where } \epsilon_0 = 8.85 \times 10^{-12} \text{ C}^2 / \text{N} \cdot \text{m}^2$$

Electrical Permittivity of vacuum

9

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- 

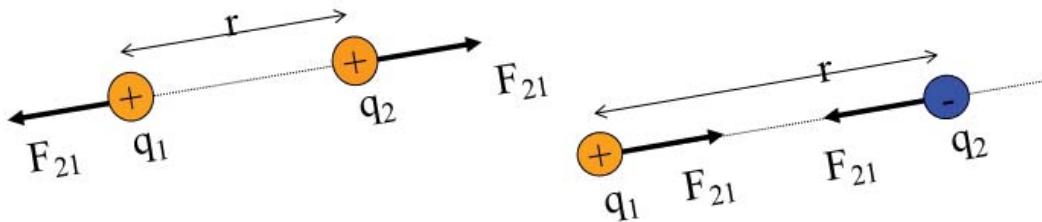

$$[F] = [k_e] \frac{[q_1][q_2]}{[r]^2}$$

$$[Newton] = [k_e] \frac{[Coulomb][Coulomb]}{[meter]^2}$$

$$[k_e] = N \cdot m^2 / C^2$$

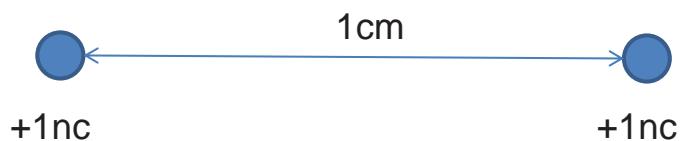

- The electrostatic force is often called Coulomb force.
- It is a force:
  - a magnitude
  - a direction.

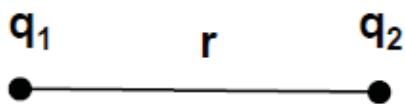

- Second example of action at a distance.

## Example 01

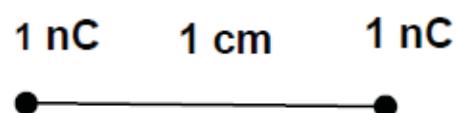

- What is the magnitude of the force between two positive charges, each 1 nano Coulomb, and 1cm apart in a typical demo?

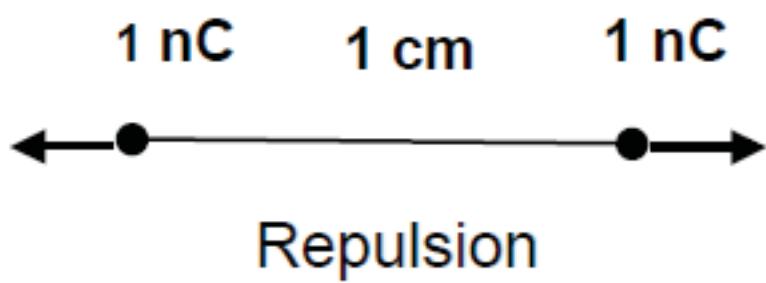

$$F = \frac{kq_1q_2}{r^2}$$

$$F = \frac{\left(8.99 \times 10^9 \frac{Nm^2}{C^2}\right) \left(10^{-9} C\right)^2}{\left(10^{-2} m\right)^2} = 9 \times 10^{-5} N$$

(Equivalent to the weight of a long strand of hair)

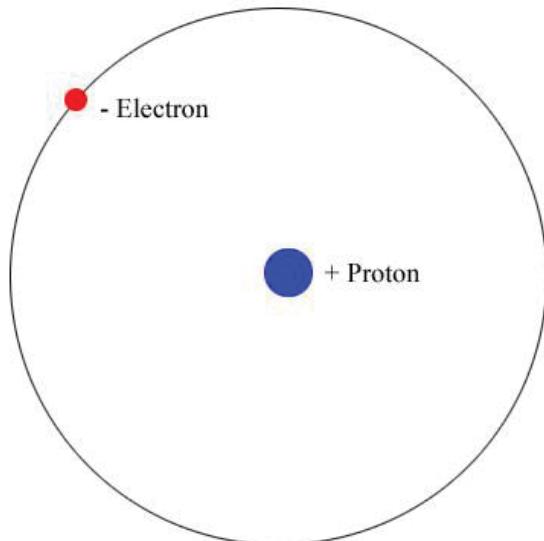

- What is the direction of the force?

Repulsion

## Example 02

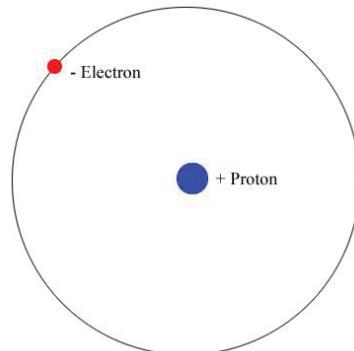

- The electron and proton of a hydrogen atom are separated (on the average) by a distance of about  $5.3 \times 10^{-11} \text{ m}$ . Find the magnitude of the electric force that each particle exerts on the other.

10

Dr. Ahmed ElShafee, ACU : Sprir

- $q_1 = -1.60 \times 10^{-19} \text{ C}$
- $q_2 = 1.60 \times 10^{-19} \text{ C}$
- $r = 5.3 \times 10^{-11} \text{ m}$

$$F_e = k_e \frac{|e|^2}{r^2} = 8.99 \times 10^9 \frac{\text{Nm}^2}{\text{C}^2} \frac{(1.6 \times 10^{-19} \text{ C})^2}{(5.3 \times 10^{-11} \text{ m})^2} = 8.2 \times 10^{-8} \text{ N}$$

- Attractive force with a magnitude of  $8.2 \times 10^{-8} \text{ N}$ .

11

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

# Example 03

- Which charge exerts the greater force? Two positive point charges,  $Q_1 = 50 \mu C$  and  $Q_2 = 1 \mu C$ , are separated by a distance  $l$ .
- Which is larger in magnitude, the force that  $Q_1$  exerts on  $Q_2$ , or the force that  $Q_2$  exerts on  $Q_1$ ?

- From Coulomb's law, the force on  $Q_1$  exerted by  $Q_1$  is

$$F_{12} = k \frac{Q_1 Q_2}{l^2}$$

- The force on  $Q_2$  exerted by  $Q_1$  is

$$F_{21} = k \frac{Q_2 Q_1}{l^2}$$

- which is the same magnitude. The equation is symmetric with respect to the two charges, so  $F_{21} = F_{12}$ .
- NOTE Newton's third law also tells us that these two forces must have equal magnitude.

# Example 04

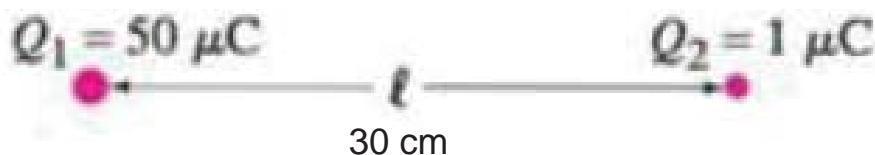

---

- In previous example, Calculate force if  $l = 30 \text{ cm}$

19

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- $F = k \frac{Q_1 \times Q_2}{r^2} =$

$$8.99 \times 10^9 \times 50 \times 10^{-6} \times 1 \times 10^{-6} / (0.3)^2 = 14.98 \text{ N}$$

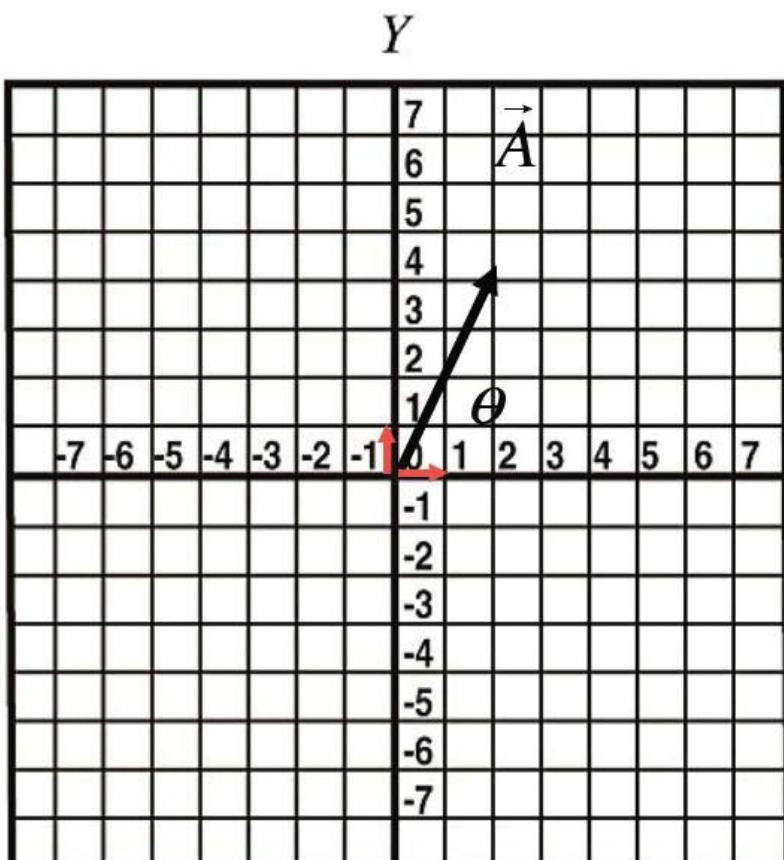

٢٠

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

# Overview on vectors

- Representation of a vector : has magnitude and direction
  - $i$  and  $j$  unit vectors
  - $x$  and  $y$  components
  - angle gives direction and length of vector gives the magnitude

## Vectors

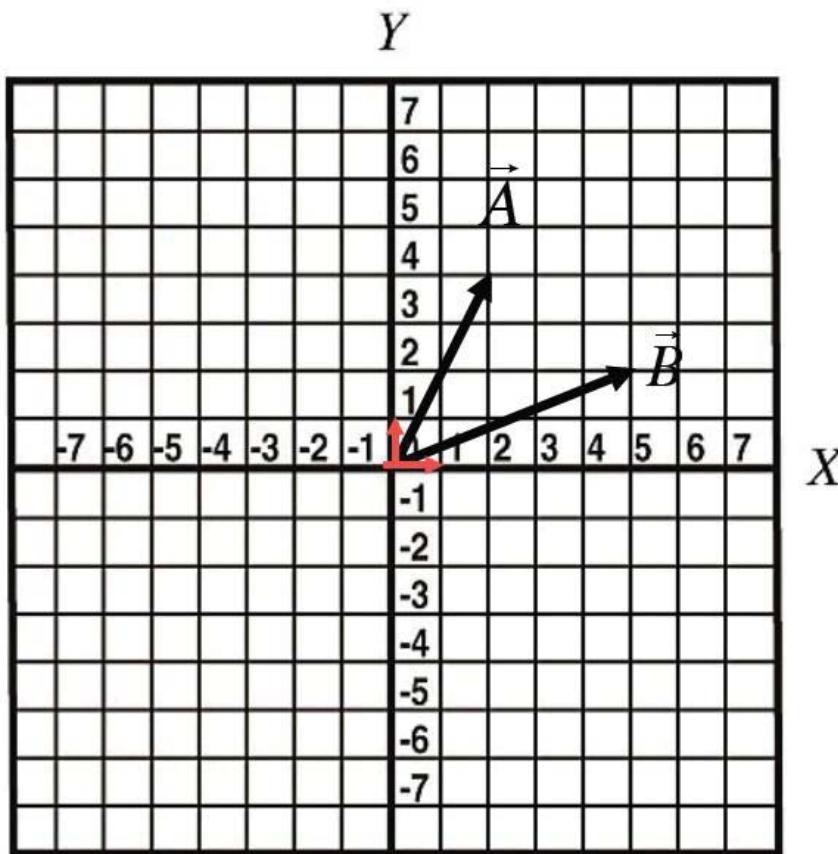

$$\vec{A} = \langle 2\hat{i} + 4\hat{j} \rangle$$

Red arrows are the  $i$  and  $j$  unit vectors.

X      Magnitude =  
 $|A| = \sqrt{2^2 + 4^2} = \sqrt{20} = 4.47$

Angle between  $A$  and  $x$  axis =  
 $\tan \theta = y / x = 4 / 2 = 2$   
 $\theta = 63.4 \text{ deg}$

# Adding Two Vectors

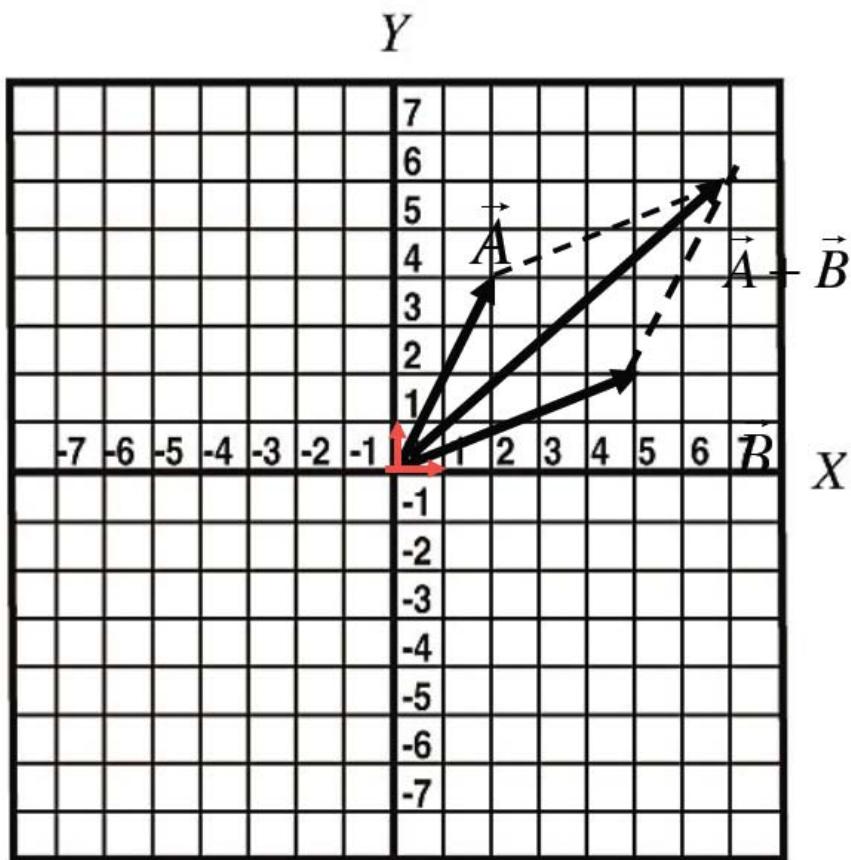

$$\vec{A} = \langle 2\hat{i} + 4\hat{j} \rangle$$

$$\vec{B} = \langle 5\hat{i} + 2\hat{j} \rangle$$

Create a  
Parallelogram with  
The two vectors  
You wish you add.

# Adding Two Vectors

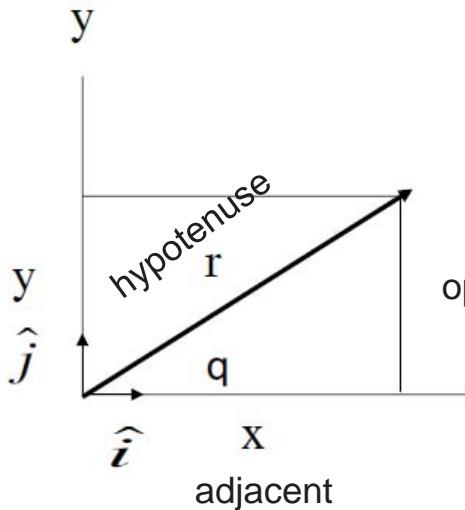

$$\vec{A} = \langle 2\hat{i} + 4\hat{j} \rangle$$

$$\vec{B} = \langle 5\hat{i} + 2\hat{j} \rangle$$

$$\vec{A} + \vec{B} = \langle 7\hat{i} + 6\hat{j} \rangle$$

Note you add x and  
y components

# Vector components in terms of sine and cosine

$$\cos \theta = \frac{x}{r} \quad x = r \cos \theta$$

$$\sin \theta = \frac{y}{r} \quad y = r \sin \theta$$

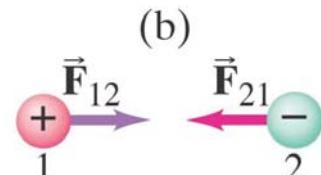

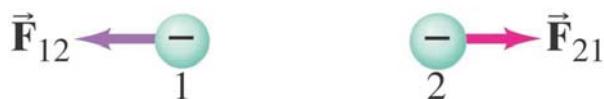

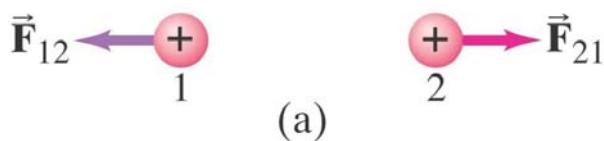

$$\mathbf{r} = x\hat{i} + y\hat{j}$$

$$\mathbf{r} = (r \cos \theta)\hat{i} + (r \sin \theta)\hat{j}$$

$$\tan \theta = y / x$$

## Coulombs Law in vector notation inline charges

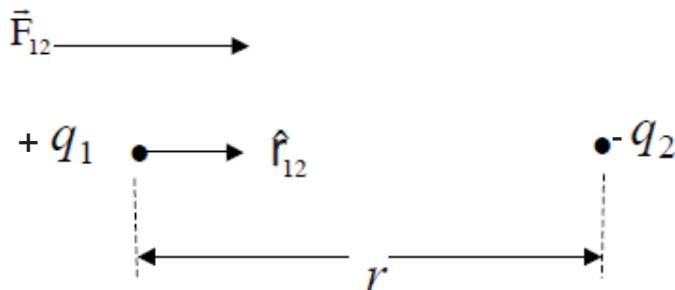

- The force is along the line connecting the charges, and is attractive if the charges are opposite, and repulsive if they are the same.  $F_{12}$  = force on 1 due to 2  $F_{21}$  = force on 2 due to 1

Newton's Third Law applies!

---

$$\vec{F}_{12} = k \frac{q_1 q_2}{r^2} \hat{r}_{12}$$

where:

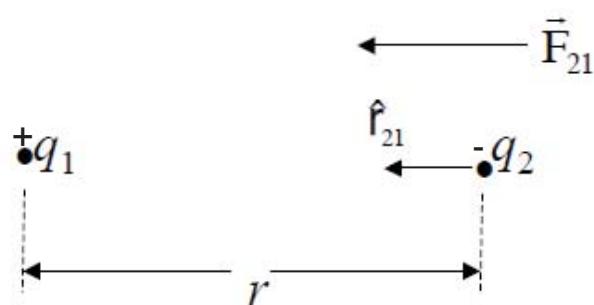

$\vec{F}_{12}$  is the force exerted by particle 1 on particle 2,

$\hat{r}_{12}$  is a unit vector in the direction “from 1 to 2”, and

$k$ ,  $q_1$ , and  $q_2$  are defined as before (the Coulomb constant, the charge on particle 1, and the charge on particle 2 respectively).

٢٤

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

where:

$\vec{F}_{21}$  is the force exerted by particle 2 on particle 1,

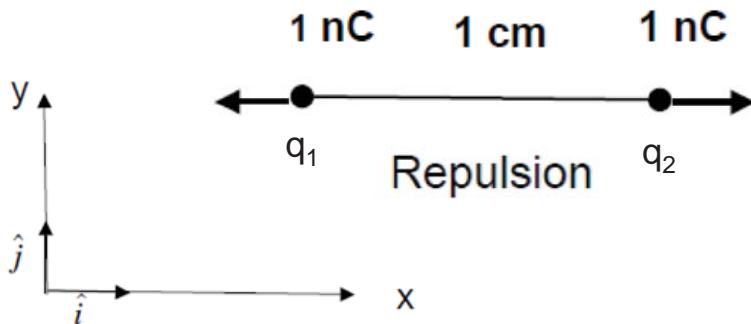

$\hat{r}_{21}$  is a unit vector in the direction “from 2 to 1”, and

$k$ ,  $q_1$ , and  $q_2$  are defined as before (the Coulomb constant, the charge on particle 1, and the charge on particle 2 respectively).

٢٨

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- Return to previous example : What is the direction of the force? In vectors notation,..

$$\mathbf{F}_1 = -9 \times 10^{-5} \text{ N } \hat{\mathbf{i}}$$

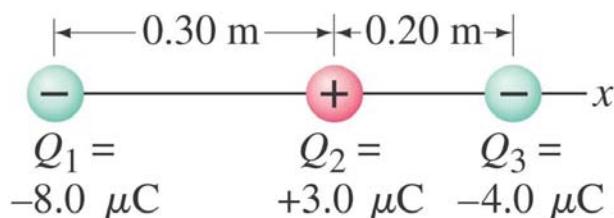

$$\mathbf{F}_2 = +9 \times 10^{-5} \text{ N } \hat{\mathbf{i}}$$

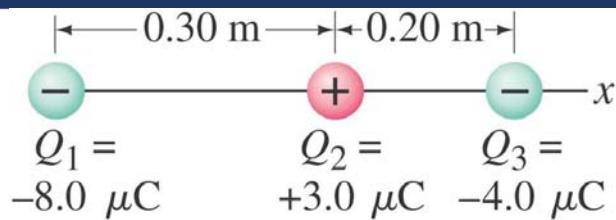

$$\mathbf{F} = \frac{\left(8.99 \times 10^9 \frac{\text{Nm}^2}{\text{C}^2}\right) \left(10^{-9} \text{ C}\right)^2}{\left(10^{-2} \text{ m}\right)^2} = 9 \times 10^{-5} \text{ N}$$

## Example 5

Three charges in a line.

- Three charged particles are arranged in a line.
- Calculate the net electrostatic force on particle 2 (the  $+3.0 \mu\text{C}$  in the middle) due to the other two charges.

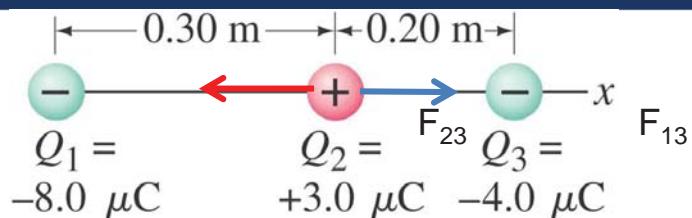

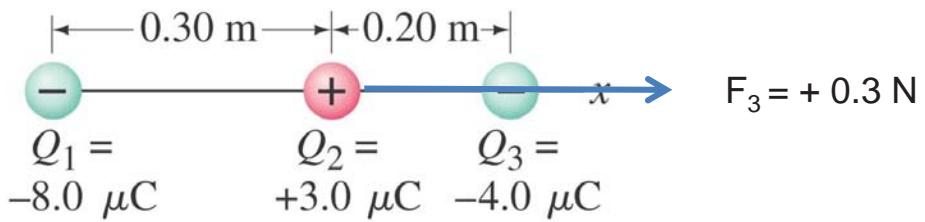

- Coulomb's law gives the magnitude of the forces on particle 2 from particle 3 and from particle 2.
- The directions of the forces can be found from the geometrical arrangement of the charges

٢١

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- $F_{21} = -8.99 \times 10^9 \times (8 \times 10^{-6} \times 3 \times 10^{-6}) / (0.3)^2 = -2.397 \text{ N}$
- $F_{23} = 8.99 \times 10^9 \times (3 \times 10^{-6} \times 4 \times 10^{-6}) / (0.2)^2 = +2.697 \text{ N}$
- $F_2 = +0.3 \text{ N}$

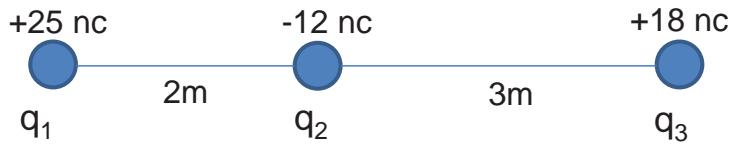

٢٢

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

# Example 06

- Three charges lie on the x axis:  $q_1 = +25 \text{ nC}$  at the origin,  $q_2 = -12 \text{ nC}$  at  $x = 2\text{m}$ ,  $q_3 = +18 \text{ nC}$  at  $x = 3\text{ m}$ . What is the net force on  $q_1$  and the direction of the force?

٣٣

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- 

- $\vec{F}_{12} = +8.99 \times 10^9 \times (25 \times 10^{-9} \times 12 \times 10^{-9})/(2)^2 = +6.7425 \times 10^{-7} \text{ N}$
- $\vec{F}_{13} = -8.99 \times 10^9 \times (25 \times 10^{-9} \times 18 \times 10^{-9})/(3)^2 = -4.495 \times 10^{-7} \text{ N}$
- $\vec{F}_1 = 6.7425 \times 10^{-7} - 4.495 \times 10^{-7} = 2.2475 \times 10^{-7} \text{ N}$

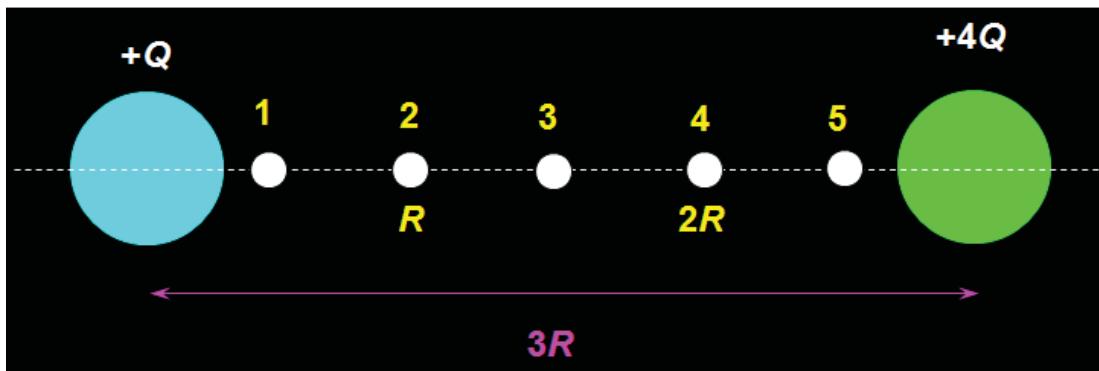

٣٤

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

# MCQ – Example 07

- Two balls with charges  $+Q$  and  $+4Q$  are separated by  $3R$ . Where should you place another charged ball  $Q_0$  on the line between the two charges such that the net force on  $Q_0$  will be zero?

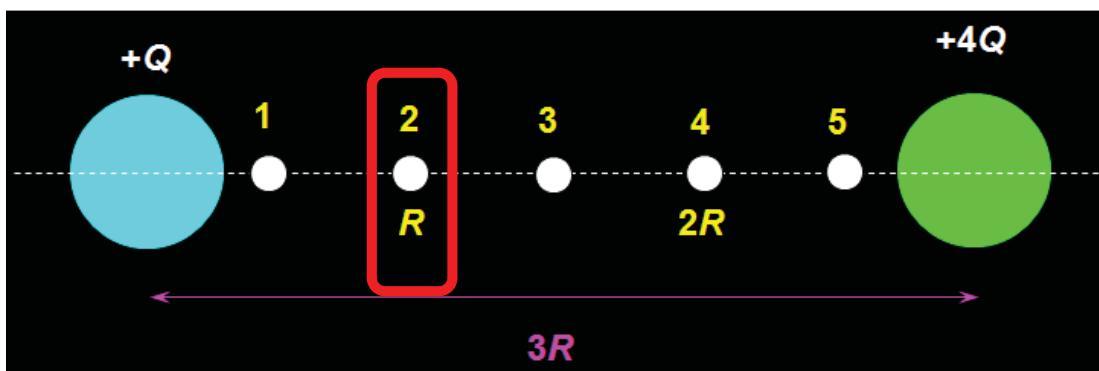

٣٥

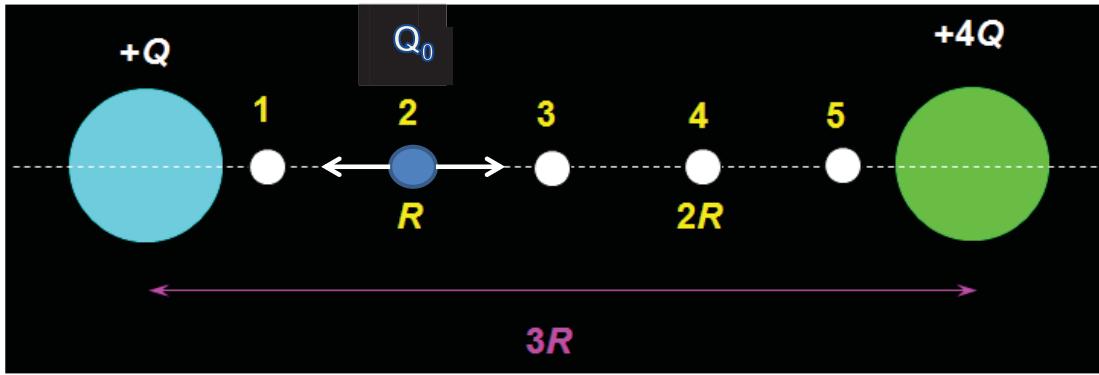

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

## MCQ solution

- Coulombs law:  $F = k(Q_1)(Q_2)/R^2$
- Since  $+4Q$  is 4 times bigger than  $+Q$ ,  $Q_0$  needs to be farther from  $+4Q$ . In fact,  $Q_0$  must be twice as far from  $+4Q$ , since the distance is squared in Coulomb's law.
- So  $Q_0$  should be placed on position 2

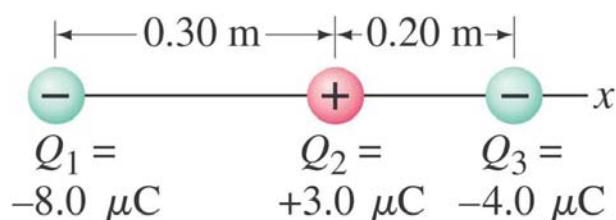

٣٦

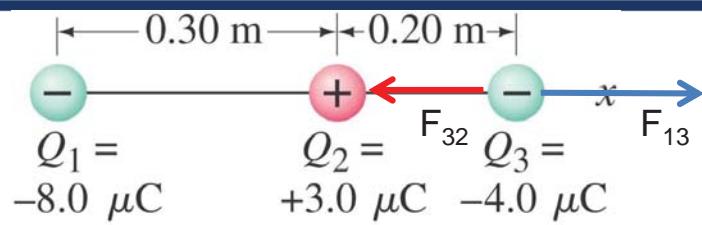

- $F_{04} = + K (Q_0 \times 4 \times Q) / (4 \times R^2)$
- $F_{01} = - K (Q_0 \times Q) / (R^2)$
- $F_0 = F_{04} - F_{01} = K(Q_0 \times Q) / R - K(Q_0 \times Q) / R = 0$

## Example 8

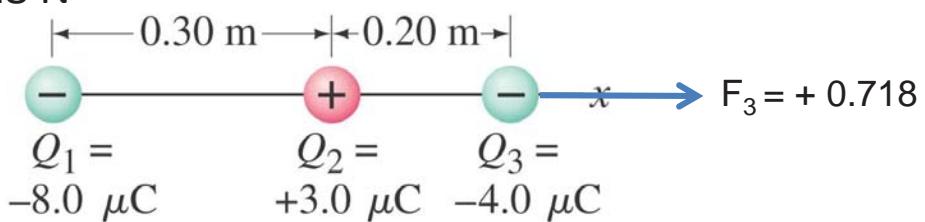

- Calculate the net electrostatic force on particle 3

- $F_{31} = + 8.99 \times 10^9 \times (8 \times 10^{-6} \times 4 \times 10^{-6}) / (0.5)^2 = 1.15 \text{ N}$
- $F_{32} = - 8.99 \times 10^9 \times (3 \times 10^{-6} \times 4 \times 10^{-6}) / (0.2)^2 = - 0.432 \text{ N}$

- $F_3 = + 0.718 \text{ N}$

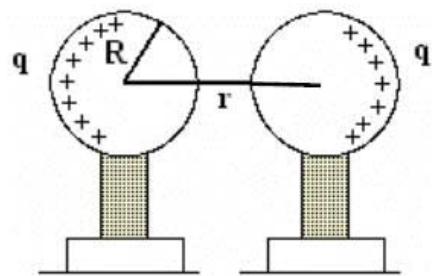

## Uniformly charged metal spheres of Radius R

- $F = K \times q_1 \times q_2 / r^2$

- $F = K \times q_1 \times q_2 / (r + 2R)^2$

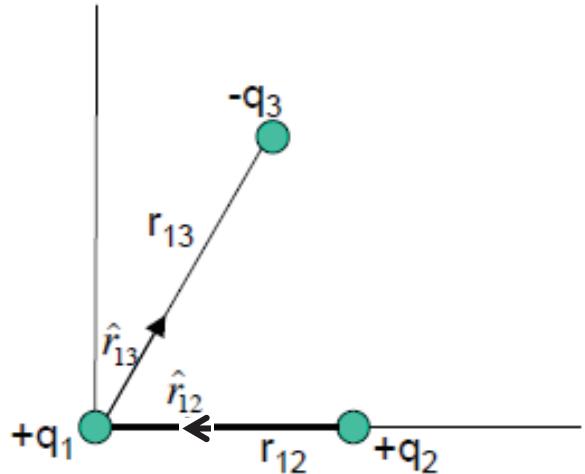

# Coulombs Law in vector notation angular charges

- What is the force on charge  $q_1$  due to many other charges lying in a plane

$$\vec{F}_{12} = \frac{kq_1q_2}{(r_{12})^2} \hat{r}_{12}$$

$$\vec{F}_{13} = \frac{kq_1q_3}{(r_{13})^2} \hat{r}_{13}$$

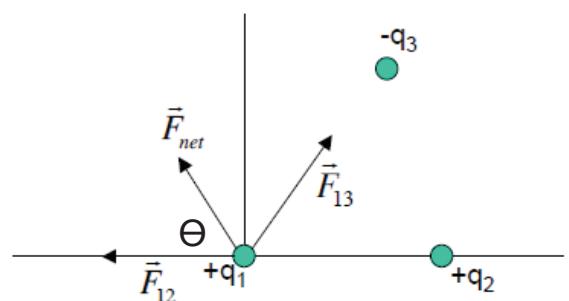

- In practice you find the x and y components of all the vectors and add them up

$$\vec{F}_{net} = \vec{F}_{12} + \vec{F}_{13}$$

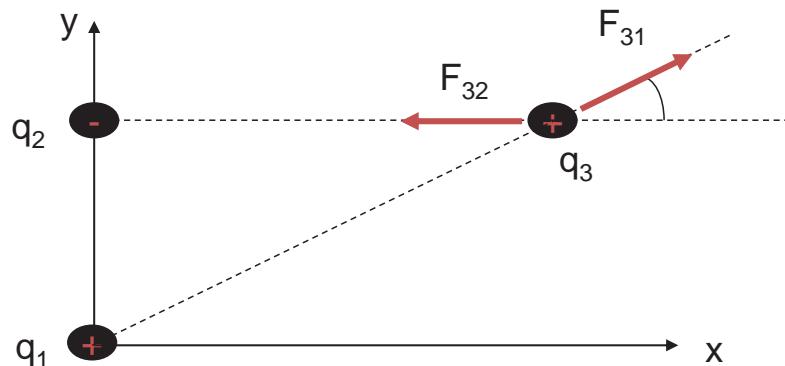

$$\vec{F}_{net} = \sum_{i=2}^N \vec{F}_{1i}$$

$$\tan \theta = \frac{F_{net y}}{F_{net x}}$$

## Superposition Principle

- From observations: one finds that whenever multiple charges are present, the net force on a given charge is the vector sum of all forces exerted by other charges.
- Electric force obeys a ***superposition principle***.

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

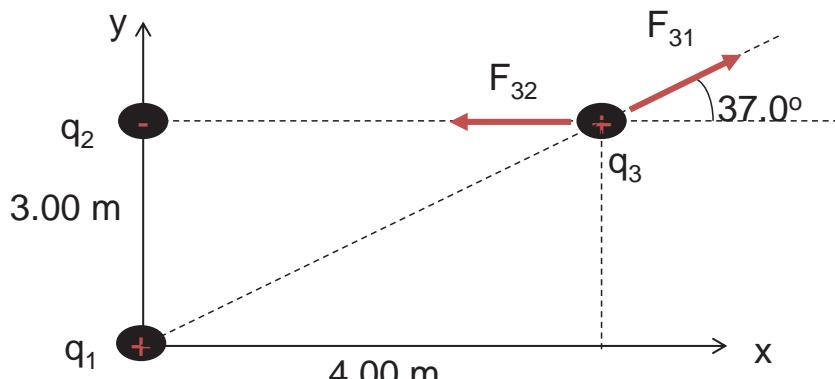

## Example 09

Consider three point charges at the corners of a triangle, as shown below. Find the resultant force on  $q_3$  if

$$q_1 = 6.00 \times 10^{-9} \text{ C}$$

$$q_2 = -2.00 \times 10^{-9} \text{ C}$$

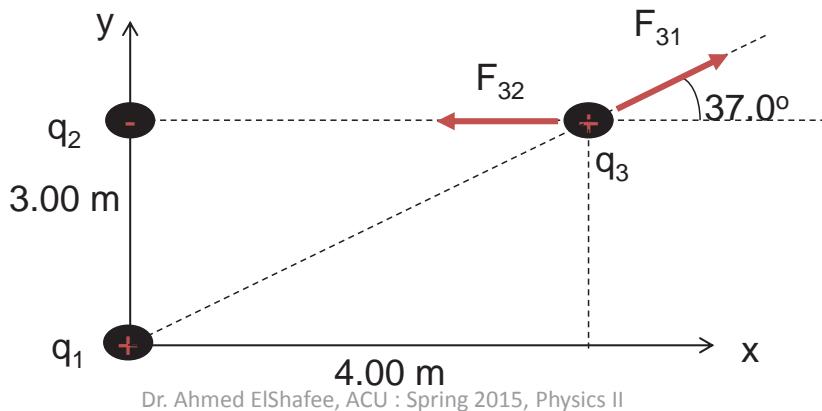

$$q_3 = 5.00 \times 10^{-9} \text{ C}$$

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

## Observations:

- The superposition principle tells us that the net force on  $q_3$  is the vector sum of the forces  $F_{32}$  and  $F_{13}$ .
- The magnitude of the forces  $F_{32}$  and  $F_{13}$  can be calculated using Coulomb's law.

- Consider three point charges at the corners of a triangle, as shown below. Find the resultant force on  $q_3$ .

$$F_{32} = k_e \frac{|q_3||q_2|}{r^2} = 8.99 \times 10^9 \frac{Nm^2}{C^2} \frac{(5.00 \times 10^{-9} C)(2.00 \times 10^{-9} C)}{(4.00 m)^2} = 5.62 \times 10^{-9} N$$

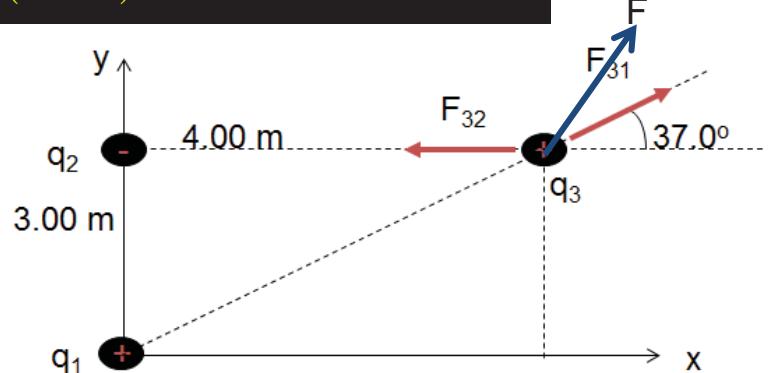

$$F_{31} = k_e \frac{|q_3||q_1|}{r^2} = 8.99 \times 10^9 \frac{Nm^2}{C^2} \frac{(5.00 \times 10^{-9} C)(6.00 \times 10^{-9} C)}{(5.00 m)^2} = 1.08 \times 10^{-8} N$$

$$F_x = F_{32} + F_{31} \cos 37.0^\circ = 3.01 \times 10^{-9} N$$

$$F_y = F_{31} \sin 37.0^\circ = 6.50 \times 10^{-9} N$$

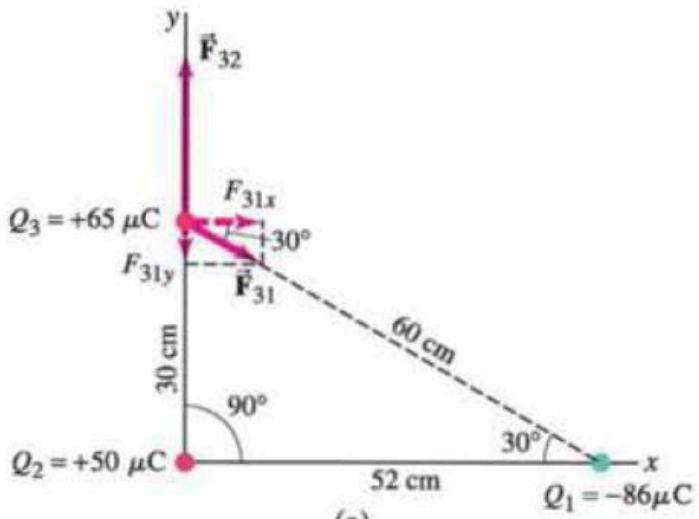

$$|F| = \sqrt{F_x^2 + F_y^2} = 7.16 \times 10^{-9} N$$

$$\theta = 65.2^\circ$$

# Example 10

- Calculate the net electrostatic force on charge  $Q_3$ , due to the charges  $Q_1$  and  $Q_2$ .

٤٧

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

$F_{23}$

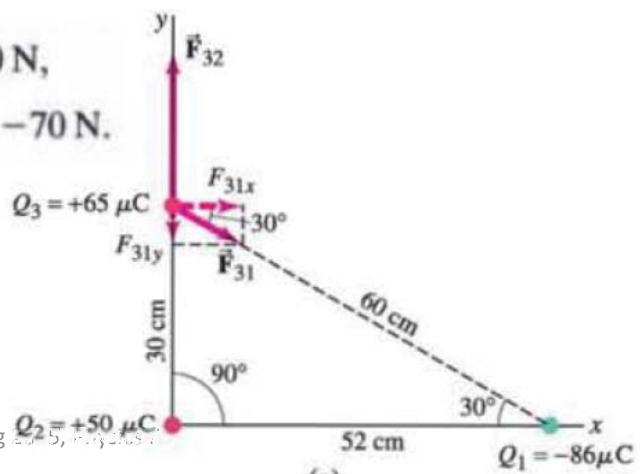

$$F_{31} = k \frac{Q_3 Q_1}{r_{31}^2} = \frac{(9.0 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(6.5 \times 10^{-5} \text{ C})(8.6 \times 10^{-5} \text{ C})}{(0.60 \text{ m})^2} = 140 \text{ N},$$

$$F_{32} = k \frac{Q_3 Q_2}{r_{32}^2} = \frac{(9.0 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(6.5 \times 10^{-5} \text{ C})(5.0 \times 10^{-5} \text{ C})}{(0.30 \text{ m})^2} = 330 \text{ N}.$$

- We resolve  $F_{31}$  into its components along the  $x$  and  $y$  axes,

$$F_{31x} = F_{31} \cos 30^\circ = (140 \text{ N}) \cos 30^\circ = 120 \text{ N},$$

$$F_{31y} = -F_{31} \sin 30^\circ = -(140 \text{ N}) \sin 30^\circ = -70 \text{ N}.$$

٤٨

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- The force  $\vec{F}_{32}$  has only a  $y$  component. So the net force  $\vec{F}$  on  $Q_3$  has components

$$F_x = F_{31x} = 120 \text{ N},$$

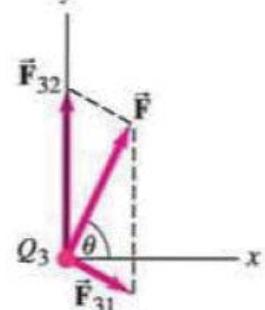

$$F_y = F_{32} + F_{31y} = 330 \text{ N} - 70 \text{ N} = 260 \text{ N}.$$

The magnitude of the net force is

$$F = \sqrt{F_x^2 + F_y^2} = \sqrt{(120 \text{ N})^2 + (260 \text{ N})^2} = 290 \text{ N};$$

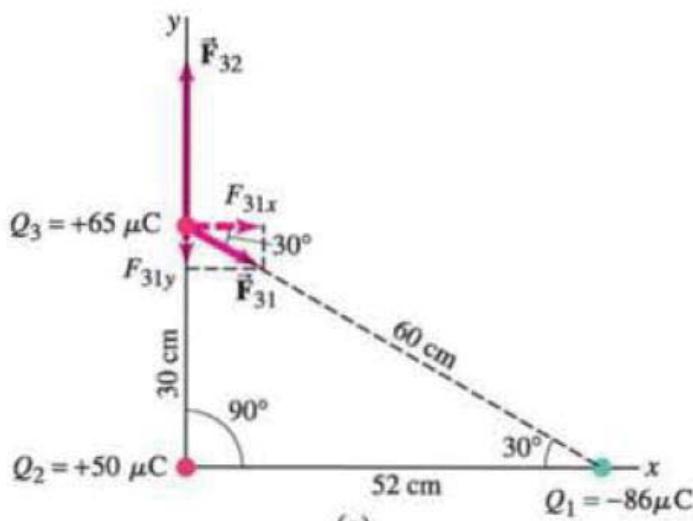

$$\frac{F_y}{F_x} = \frac{260 \text{ N}}{120 \text{ N}} = 2.2,$$

$$\theta = \tan^{-1}(2.2) = 65^\circ.$$

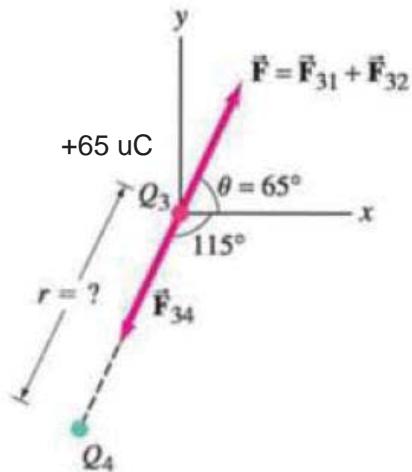

## Example 11

- Make the force on  $Q_3$  zero. where could you place a fourth charge,  $Q_4 = -50 \mu\text{C}$ , so that the net force on  $Q_3$  would be zero?

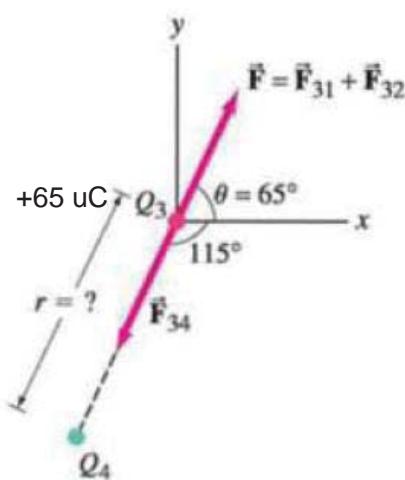

- By the principle of superposition, we need a force in exactly the opposite direction to the resultant  $\mathbf{F}$  due to  $Q_2$  and  $Q_1$  that we calculated in last example.
- Our force must have magnitude 290N, and must point down and to the left of  $Q_3$ .
- So  $Q_4$  must be along this line.

o 1

Dr. Ahmed ElShafee, ACU : Sprir

- $F_{34} = 290 \text{ N} = 8.99 \times 10^9 \times (65 \times 10^{-6}) \times (50 \times 10^{-6}) / r^2$
- $r_{34} = .317 \text{ m}$

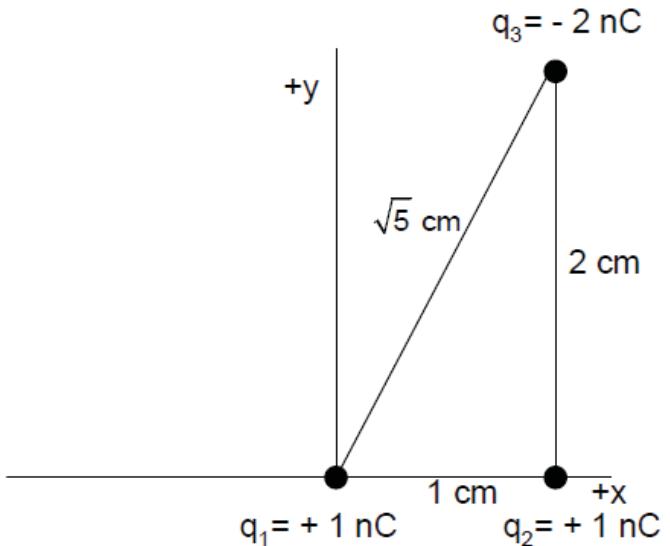

o 2

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

# Example 12

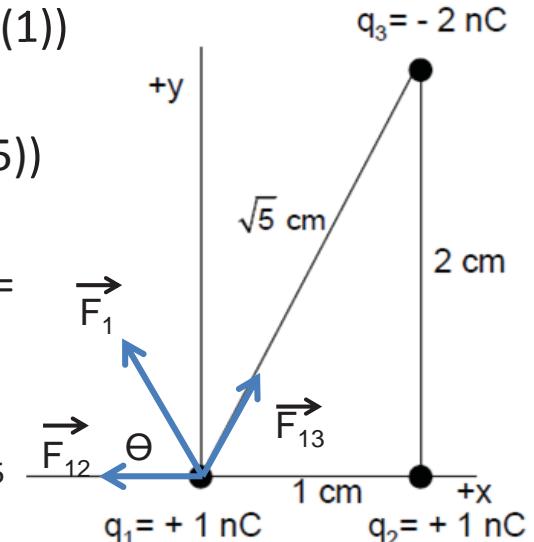

- What is the net force on  $q_1$  and in what direction?

o ٣

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- $\vec{F}_{12} = - (8.99 \times 10^9 \times (1 \times 10^{-9} \times 1 \times 10^{-9}) / (1)) = - 8.99 \times 10^{-9}$
- $\vec{F}_{13} = (8.99 \times 10^9 \times (1 \times 10^{-9} \times 2 \times 10^{-9}) / (5)) = (3.6 \times 10^{-9}) \text{ N}$
- $\vec{F}_{1x} = - 8.99 \times 10^{-9} + 3.6 \times 10^{-9} \times (1/5^{0.5}) = - 7.36 \times 10^{-9}$
- $\vec{F}_{1y} = (3.6 \times 10^{-9}) \times (2/5^{0.5}) = 3.22 \times 10^{-9}$
- $|F_1| = ((7.36 \times 10^{-9})^2 + (3.22 \times 10^{-9})^2)^{0.5} = 8.034 \times 10^{-9} \text{ N}$
- $\Theta = \tan^{-1} (+ (3.22 \times 10^{-9}) / (-7.36 \times 10^{-9})) = - 26.06^\circ$

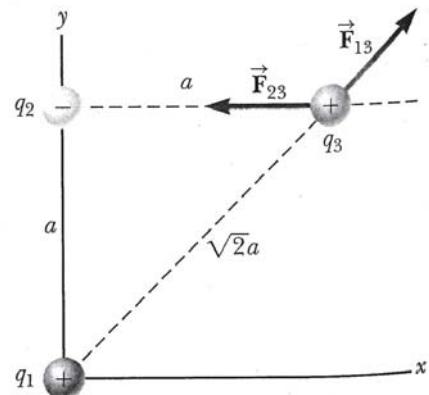

o ٤

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

# Example 13

- What is the net force on  $q_3$  and in what direction?

$$q_1 = q_3 = 5.00 \mu C$$

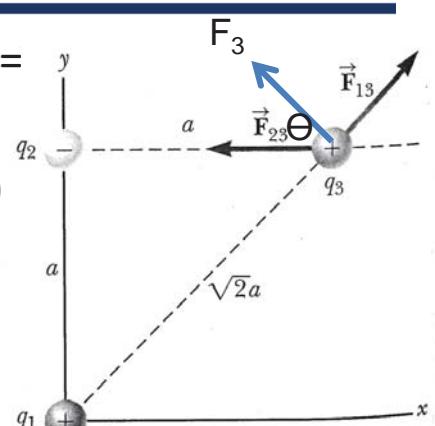

$$q_2 = -2.00 \mu C$$

$$a = 0.100 m$$

..

Dr. Ahmed ElShafee, ACU : Spring 2015, Physics II

- $\vec{F}_{13} = 8.99 \times 10^9 \times (5 \times 10^{-6} \times 5 \times 10^{-6})/(0.02) = 11.24 \text{ N}$
- $\vec{F}_{23} = -8.99 \times 10^9 \times (5 \times 10^{-6} \times 2 \times 10^{-6})/(0.01) = 8.99 \text{ N}$
- $\vec{F}_{3x} = +11.24 \times (.1/(2^{0.5} \times .1)) - 8.99 = 7.95 - 8.99 = -1.42 \text{ N}$
- $\vec{F}_{3y} = +11.24 \times (.1/(2^{0.5} \times .1)) = 7.95 \text{ N}$
- $\Theta = \tan^{-1} (7.99 / -1.42) = -80^\circ$

$$q_1 = q_3 = 5.00 \mu C$$

$$q_2 = -2.00 \mu C$$

$$a = 0.100 m$$

..
